PRABAL SERIES

Crane Duty Motors

Crompton Greaves (CG) is part of the US\$ 4 bn Avantha Group, a conglomerate with an impressive global footprint.

Since its inception CG has been synonymous with electricity. CG's India operations were established in 1937, and since then the company has retained its leadership position in the management and application of electrical energy.

Today, Crompton Greaves India's largest private sector enterprise. It has diversified extensively and is engaged in designing, manufacturing and marketing technologically advanced electrical products and services related to power generation, transmission and distribution, besides executing turnkey projects. The company is customer-centric in its focus and is the single largest source for a wide variety of electrical equipments and products.

With several international acquisitions, Crompton Greaves is fast emerging as a first choice global supplier for high quality equipment through its three business groups viz;

Power Systems :

- Transformer ● Switchgear ● Power Quality
- Engineering Projects

Industrial Systems :

- Motors ● Alternators ● Drives
- Railway Signalling ● Stampings

Consumer Products :

- Fans ● Appliances ● Lighting
- Integrated Security Solutions & Home Automation ● Pumps

APPLICATION

Prabal series squirrel cage/slip ring Crane duty motors are specially designed for service on cranes and hoists. They can also be used for similar applications such as material handling equipments, and cranes of all types. These motors can serve as auxiliary motors in rolling mills or wherever intermittent duty drives are required.

These are duty type rated motors developing high starting torque with low starting current. The motors are suitable for frequent starts/ stops and reversals. Also rapid acceleration is achieved by high pull out torque/rotor inertia ratio.

TYPICAL APPLICATIONS :

Crane duty motors are used for following applications in majority:

- Cranes & hoists: long travel drive, cross travel drive, main hoist, auxiliary hoist.
- Material handling equipments: various conveyors
- Lifts
- Rolling mills

RANGE

Manufacturing range for cast iron slip ring crane duty motors is from 112 to 400 frame.

The same for squirrel cage motors in cast iron enclosure is from 80-400 & in aluminium enclosure is from 63-160.

CE marking : All motors are with CE marking.

MOUNTING

Squirrel cage crane duty motors are supplied with horizontal foot-mounting. However, motors suitable for foot / flange / face mounting or any combination of these with vertical or horizontal orientation can be offered when required. Slip ring motors are normally available with foot mounting Flange mounting can be supplied on specific request.

POWER SUPPLY

Crane duty motors are suitable for 3 phase supply and can be wound for any single voltage from 220 to 650 volts and frequencies from 50 Hz or 60 Hz. The rotor voltage is committed for stator supply of 415 V, 50 Hz. For other supply conditions, R_v to be confirmed from CG.

AMBIENT TEMPERATURE

The motors are rated at 45°C ambient temperature. For temperatures, other than 45°C, a deration factor has to be applied as indicated below.

DERATION FACTORS :

Ambient temperature :

Ambient Temperature	Deration factor
50°C	0.88
55°C	0.83
60°C	0.75

Table 1

Altitude :

The motors are suitable for altitude upto 1000 m above mean sea level. For altitudes more than this, deration factor shall be as per below :

Altitude in m above MSL	Deration factor
1000	1.00
1500	0.95
2000	0.90
2500	0.84
3000	0.78
3500	0.75
4000	0.70

Table 2

STANDARD OPERATING CONDITIONS

Power supply :	415 volts, 3 phase, 50 Hz
Voltage variation :	± 10%
Frequency variation :	± 5%
Combined voltage and frequency Variation :	± 10% (absolute sum)
Ambient temperature :	45°C
Altitude :	upto 1000m.

STANDARD SPECIFICATIONS**PERFORMANCE AND FIXING DIMENSIONS**

The motors are manufactured with standard metric frame sizes, and they comply with the following standards (latest versions).

IS: 325	IS:4722
IS:1231	IS:2223
IS:3177	IEC:60034-1
IS: 807	

Motors with following steel plant specifications also can be supplied on request :

IPSS: 1-03-003 IPSS:1-03-004

For detail dimensions, please refer drawings on page 31-37 in this publication.

CONSTRUCTIONAL FEATURES : (MECHANICAL)**STATOR FRAME AND ENDSHIELDS**

Made of high quality cast iron conforming to IS:210, ribbed externally to ensure maximum heat dissipation. All components are machined on CNC machines ensuring concentricity and correct alignment. The windings and working parts are completely enclosed and air is forced over the stator body by fan, mounted on the shaft and protected by a cowl. The feet are integrally cast with the body. This ensures sturdiness and resistance to vibrations.

STATOR AND ROTOR CORES

Both the stator and rotor cores consist of low loss and high permeability steel stampings which are assembled under pressure and rigidly secured by end plates.

ENCLOSURE AND COOLING

Standard crane duty motors have IP55 degree of protection as per IS:4691. IP 56 & 66 can be provided on request. The cooling code of motor is IC 411 as per IS:6362.

SHAFTS AND BEARINGS

The shaft is of high grade steel and of appropriate diameter to withstand the bending and torsional stresses. All shafts are ultrasonically tested for any minor flaw in the material. Shafts are machined to extreme fine limits to ensure fit and interchangeability of bearings. The motors are provided with single shaft extension. Special shaft extensions like :

- 1) change in diameter and length,
- 2) taper shaft, with threaded end, and with hexagonal nut and lock washer.
- 3) double shaft extensions, (cylindrical & taper) are available on request.

Motors are provided with deep groove ball bearings. They are mounted with extreme care in dust proof housing. (Refer bearing size table for details).

Sealed bearings are provided for motors upto frame 225M. Grease lubricated bearings are used on frames 250 and above. The correct amount of grease is filled in the bearings during manufacturing. On line greasing facility is provided for 250 frame & above to facilitate greasing of bearings without dismantling the motor.

For provision of insulated bearings, please refer to CG.

Table 4

TERMINAL BOX

Terminal box is provided with IP55 degree of protection. The box can be turned through 360° in steps of 90° to give cable entry from any one of four positions. The terminal boxes are suitable for BS screwed conduit. However, fittings like double compression type cable glands are available on request.

Table 3

Terminal box position can be provided as per table below :

FRAME SIZE	ROTOR TYPE	Standard TB POSITION	Other possible TB positions
112-315	Slip ring	Top	RHS or LHS
355-400	Slip ring	At 45°, Stator TB on RHS from DE Rotor TB on LHS from DE	--
63-71	Squirrel cage	TOP	--
80-315	Squirrel cage	RHS from DE	TOP
355-400	Squirrel cage	At 45°, TB on RHS from DE	At 45°, TB on LHS from DE
ND250MX	SCR	RHS	LHS
NDW250MX	SR	RHS	LHS

Table 5

SLIPRING AND BRUSH GEAR

All sliprings are made of cupro-nickel. The slipring unit is having high insulation resistance ensuring minimum wear and breakdown. The brush holders are assembled as a complete unit which can be easily replaced. The slipring enclosure is dustproof & has a cover with accessibility for inspection. The slip rings are epoxy moulded / fabricated type as per requirement.

MOTOR GD. SQ.

For large no. of starts, it is necessary that the accelerating time of the system should be as small as possible. For this purpose, total inertia of the system (motor GD sq. + Load GD sq.) should be minimum. Motor GD sq. value and permissible load GD sq. are indicated in the tables.

INTERCHANGEABILITY AND SPARES

All Prabal series crane duty motors are built to standardised designs and all spare parts are interchangeable.

CONSTRUCTIONAL FEATURES (ELECTRICAL)

Class of Insulation :

Stator : Class F insulation with temperature rise limited to class B

Rotor : Class H insulation with temperature rise limited to class F

Prabal series crane duty motors with higher class for stator insulation (class H) can also be offered on request.

WINDINGS

STATOR WINDINGS

Stator winding (and rotor winding in case of slipring motors) consists of enamelled copper wire impregnated with superior quality class F varnish which is rigid at all working temperatures.

Stators in motors with frame 280 & above are manufactured with vacuum pressure impregnation process as a standard. All rotors irrespective of frame size are processed with vacuum pressure impregnation. This gives added electrical & mechanical strength to the winding for high number of starts. The varnish has a high insulation resistance and excellent resistance to moisture, saline atmosphere, acidic/ alkaline fumes, and also to oil and grease. The insulation gives complete reliability under all atmospheric conditions, including humid tropical climates. Stator and rotor wound packs are subjected to surge test before impregnation.

ROTOR WINDINGS

1. Wound rotor

Rotors of slip ring motors are wound and impregnated similar to stator windings. In addition, rotor windings are braced with resiglass banding. This gives protection against centrifugal forces experienced by overhang during overspeed and frequent reversals. Gelcoat is provided on the winding overhang for better consolidation and protection from vibration. Strip wound rotors are provided on frames 355 and above.

2. Cage rotor

Rotors are of pressure diecast aluminium upto 355 frame. They are designed for high starting torque, suitable for high number of starts. Cooling fins cast integrally with the rotor cage, improve the cooling action within the motor. All rotors (cage and wound) are dynamically balanced to comply with the requirements of IS: 12075

TERMINAL ARRANGEMENT

The terminals are mounted on a moulded base and are enclosed in a box having an inspection cover. In case of slip ring motors, three terminals for stator and three terminals for rotor are terminated in terminal box with adequate creepage and clearance. The rotor terminals are in the same box as those of the stator. Separate terminal box for rotor terminals is provided for NDW355LX & NDW400LX frames. This simplifies wiring and maintenance.

EARTHING

One earthing terminal is provided in the terminal box and two terminals on mounting feet.

ACCESSORIES :

Crane duty motors can be provided with various accessories as per table below :

	Frame range (expressed as frame height)	
Accessory	available on request	standard feature
Space heater	132 to 250	280-400
Thermistor	80 to 355	No
Bearing temperature detector	225 to 355	400
Resistance temperature detector	160-355	400
On line greasing	160-225	250-400
Insulated bearings	250-400	No
MS Canopy	80-400	No
Compression glands	80-400	No

Table 6**Space heating for anti condensation :**

Space heaters are used for avoiding accumulation of moisture/water in humid atmospheres. In motors upto 200 frame size, motor windings can be heated up to keep winding temperature above ambient by 5 to 10 degrees, by giving low supply voltage upto 10% of rated voltage. Supply voltage is to be adjusted by keeping 20-25% rated current.

Thermal protection: Stator windings can be provided with PTC thermisters for alarm/trip or PT 100 type resistance temperature detectors according to the accessories table provided. Bearings can be provided with PT100 type resistance temperature detectors as per enclosed table 6.

ROTOR VOLTAGE

The rotor voltage of the motor is kept such that the insulation of the rotor and of the associated switchgear is not unduly stressed during rapid plugging when rotor voltage can rise to 2 to 3 times the rated value. Rotor voltage for slip ring motors is as per performance tables enclosed. Special rotor voltage can be offered for wire wound rotors with confirmation from CG.

PULL OUT TORQUE

The pull out torque value at rated voltage is indicated in the respective tables. Since available torque varies as the square of the supply voltage at motor terminals, an allowance for voltage drop in long cables, live rails and collectors must be considered. These voltage drops are significant when motor is operated at pull out point, since current at this point is much higher than the rated current. Pull out torque is maximum for 300 starts/hour class. This high pull out torque ensures rapid acceleration irrespective of drop

in effective torque due to stepped rotor resistance. However, care to be taken that gears and other drive transmission equipments can withstand this peak torque.

OVERLOAD CAPACITY

The motors can withstand 1.5 times the rated current for 2 minutes without suffering damage. This feature makes the motor suitable for severe duties experienced on the crane or similar applications.

LIFE OF THE MOTOR

Crompton Greaves crane duty motors are designed and manufactured with carefully selected and tested insulating materials to ensure long services. The life of the motor mostly depends upon the life of the insulating materials since bearings, brush gears, slip rings etc. can be replaced easily during normal maintenance.

MAXIMUM PERMISSIBLE OPERATING SPEED

All 4, 6, 8, and 10 pole motors are designed for withstanding an over speed of 2.5 times rated synchronous speed or 2000 rpm whichever is less.

VFD CRANE DUTY MOTORS (Cast Iron)

Crane duty squirrel cage motors when used with inverter drives give better current control, speed control & improved operation. Current control is similar or better than slip ring motors & maintenance cost /efforts are less than equivalent slip ring motors. Current control of VFD driven motors is better than standard squirrel cage motors.

Prabal series Inverter duty motors are provided with special insulation system suitable to withstand voltage spikes when fed from inverters. The motors are provided with following features:

- Vacuum pressure impregnation of stator winding, this gives less voids & stronger winding.
- Strengthened insulation system for withstanding voltage stresses.

Standard features :

Base Voltage: 220 volts to 650 volts

Base frequency: 50 or 60 Hz

Insulation class: Class "F" or 'H' as required (temp rise limited to class B)

CG make motors are suitable for the following IGBT drive output

- High frequency in the range of 3kHZ - 6 k HZ.
- Voltage rise time > 0.1 sec.
- Voltage spikes up to 1600V and rise time of 0.1 sec.
- THD < 3%

Mode of operation: Modes of operation of inverter driven motors are classified according to type of load & speed range. They are:

- Variable torque
- Constant torque
- Constant power.

In case of cranes/hoists, the mode of operation is constant torque. The typical speed range is from 10% to 100% of synchronous speed. The speed during lowering cranes in unloaded conditions may be more. The limiting speed should not exceed 2.5 times of rated synchronous speed or 2000 rpm whichever is less.

The selection of frame size for various duty type & starts shall be as per table enclosed.

For higher cable length from drive to motor, use suitable dv/dt filters & a lower switching frequency.

Use of insulated bearing at non driving is recommended for frame size above 315 to reduce bearing failure due to shaft currents.

Use of thermisters for frames upto 250 & resistance temperature detectors for frame 280 & above is recommended.

Additional losses & temperature rise :

Harmonics of voltage & current in a cage induction motor supplied from a converter cause additional iron & winding losses in the stator & the rotor.

There is no simple method to calculate the additional losses & no general statement can be made about their value.

When the motor is tested with converter supply at rated load, base voltage & base frequency, the permissible temperature rise will be within the limits of the insulation system used. For example when a motor havinf class F insulation system is tested with sinusoidal supply at rated voltage , rated frequency & rated load, may have temperature rise within class B limits. However, when the same motor is tested with converter supply under same test conditions, the temperature rise will be within class F limits. It is assumed that, while testing with converter supply, the HVF factor of converter output supply, is maximum 3%.

Hence the outputs of crane duty inverter driven motors are as listed in the table on page 28-30.

GENERAL REQUIREMENT :

All additional general requirements like accessories, paint shade, insulation class, degree of protection, voltage and frequency variation shall be available at extra cost. The cost structure of extra features is same as that for standard motors.

DEFINITIONS

The terms used frequently in intermittent duly drive and hoisting are as bellow :

1. Duty :

Operation of the motor at load including no load and de- energised period to which the motor is subjected, including the sequence and duration.

2. Cyclic duration factor (CDF) :

The ratio between the period of loading including starting and electric braking and the duration of the duty- cycle expressed as percentage.

3. Starting :

The process of energizing a motor to bring it upto rated speed from rest.

4. Jogging or inching :

This is an incomplete start during which the motor does not attain more than 25% of the rated speed.

5. Electric braking :

A system in which a braking action is applied to an electric motor by causing it to act as a generator.

6. D.C. Injection braking :

A form of braking of an induction motor in which a separate dc supply is used to magnetise the motor.

7. Plug braking :

A form of electric braking of an induction motor obtained by reversing the phase sequence of its any two lines.

8. Regenerative braking :

A system of electric braking in which energy is returned to the supply system.

INTERMITTENT DUTY TYPE RATINGS.

The basis of the ratings is that of thermal capability, taking into account,

- i) Frequency of starting (starting class).
- ii) Percentage of time during each operating cycle the motor is energized, (CDF)
- iii) The number and type of cycle per hour, (duty class)
- iv) and the inertia of the motor and the load.

CLASSIFICATION OF STARTING :

The starting classification for a motor indicates the maximum permissible number of starts per specified inertia, taking into account complete starting, jogging or inching and electric braking. Rating for the commonly used starting, i.e. 6,150 and 300 starts/hour class, are listed in this publication. However, following factors can be used to calculate output rating for different number of starts and CDFs.

Starts/hour	40%CDF	60%CDF
600	0.7	0.67
500	0.8	0.74
400	0.9	0.8
300	1	Listed
200	1.1	0.96
150	Listed	1
100	1.21	1.05
50	1.28	1.1

Table 7**EQUIVALENT STARTS PER HOUR :**

When calculating for the duty, allowance should be made for inching and reverse current braking on the following basis :

Squirrel cage motors :

- 4 jogs or inchings or jerks = 1 start
- 1 plug braking = 3 starts
- 1 dc injection braking = 2 starts
- 1 plug reversal = 4 starts

Slip ring motors :

- 4 jogs or inchings or jerks = 1 start
- 1 plug braking = 0.8 starts
- 1 plug reversal = 1.8 starts

DUTY TYPE :

Crane duty applications can be classified into duty types S2 to S10. The duty types are as per table 4 below:

Duty type	Description
S2	Short-time duty
S3	Intermittent periodic duty
S4	Intermittent periodic duty with starting
S5	Intermittent periodic duty with electric braking
S6	Continuous operation periodic duty
S7	Continuous operation periodic duty with electric braking
S8	Continuous operation periodic duty with related load/speed changes
S9	Duty with non-periodic load and speed variations
S10	Duty with discrete constant loads and speeds

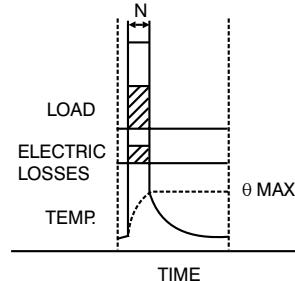

Table 8

The duty types S2 to S5 are explained in detail as per below:

Short time duty (duty type S2) :

Operation at constant load during a given time, less than that required to reach thermal equilibrium, followed by a rest and de-energised period of sufficient duration to re-establish machine temperatures within 2°C of the coolant. (See figure 1)

The recommended values for the short time duty are 10, 30 and 90 minutes.

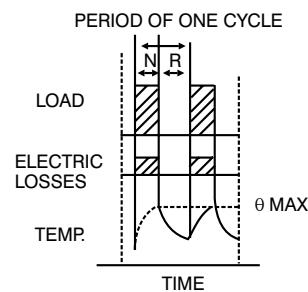

θ MAX = MAX. TEMP. ATTAINED DURING DUTY CYCLE
N = OPERATION AT CONSTANT LOAD

SHORT TIME DUTY, DUTY TYPE S2

Figure 1**Intermittent periodic duty (duty type S3) :**

A sequence of identical duty cycle, each including a period of operation at constant load and a rest and de-energised period. These periods being too short to attain thermal equilibrium during one duty cycle. (See Fig. 2) In this duty type, the starting current dose not significantly affect the temperature rise. Unless otherwise specified, the duration of the duty cycle is 10 minutes. The recommended values for the CDF are 15, 25, 40 and 60 percent.

θ MAX = MAX. TEMP. ATTAINED DURING DUTY CYCLE
N = OPERATION AT CONSTANT LOAD
R = AT REST & DE - ENERGISED

$$\text{CYCLIC DURATION FACTOR} = \frac{N}{N+R} \quad 100\%$$

INTERMITTENT PERIODIC DUTY DUTY TYPE S3

Figure 2**Intermittent periodic duty with starting (duty type S4) :**

A sequence of identical duty cycles, each cycle including a significant period of starting, a period of operation at constant load and a rest and de-energised period. These periods being too short to attain thermal equilibrium during one duty cycle. (See Figure 3) In this duty, the stopping of the motor is obtained either by natural deceleration after disconnection of the supply or by means of braking such as mechanical brake which does not cause additional heating of the windings.

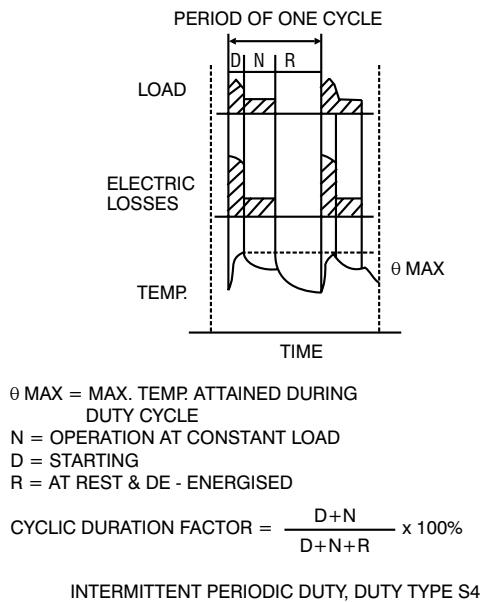

Figure 3

Intermittent periodic duty with starting and braking (duty type S5)

A sequence of identical duty cycles, each cycle consisting of a period of starting, a period of operation at constant load, a period of rapid electric braking and rest and de-energised period. The operating and rest and de-energised periods being too short, to attain thermal equilibrium during one duty cycle. (See Fig. 4)

Note : In all above types of duties, the loading period and rest period of the cycle are so short that the steady state temperature is not reached. While working on these identical cycles continuously, the motor temperature rise must not exceed the permissible values for a given class of insulation.

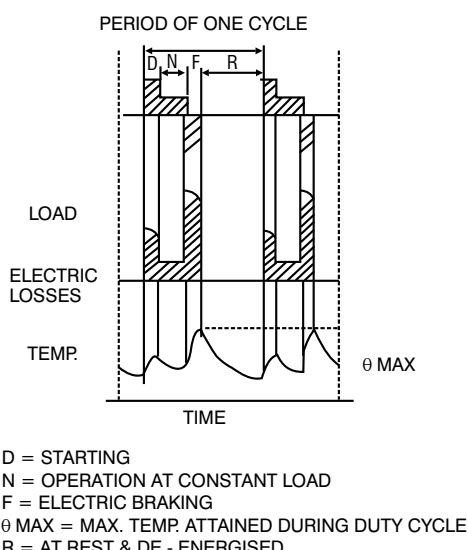

Figure 4

Selection of motors for hoist motions :

For hoisting motor, the power required shall not be less than that computed from the following :

$$Kw = \frac{MVCvCdf}{6.12 E} \times \frac{1}{Camb}$$

Where, derating factor will be taken as 12%,

Kw = one hour power rating for dc motors & power rating at (S - 40%) cyclic duration factor for ac motors.

M = mass of rated load on hook plus weight of hook block & wire ropes in tones

V = specified hoisting speed in M/min

E = combined efficiency of gears & sheaves

= $(0.93)n \times (0.98)m$ for sleeve bearings

= $(0.95)n \times (0.99)m$ for antifriction bearings

= $(0.985)n \times (0.99)m$ for hardened profile ground & oil splashed lubricator, where

n = number of pairs of gears

m = total number rotating sheaves passed over by each part of the moving rope attached to the drum

Cv = service factor for vertical motion depending on type of motors,

= 0.67 for ac motors,

= 0.5 for dc motors

Cdf = duty factor

Camb = Derating factor for ambient temperature as per table 1.

For an ac hoist motor, the specified full load hoist speed must be obtained at not more than rated torque, therefore, the calculated full load kw must be multiplied by :

$$\frac{(100 - \text{rated slip \%})}{(100 \text{ total ohms at full speed \%})}$$

Where sufficient information is not available values given in table 9 below for duty cycles, cyclic duration factor & starting class corresponding to mechanism class shall be used. The values given are based on the following formula :

Cyclic duration factor =

$$\frac{\text{operating time} * 100}{\text{Operating time} + \text{idle time}}$$

Recommended cyclic duration factor & starting class :

Mechanism Class	Duty cycle Number of cyclic class (c) Cycles/hour percent	Recommen-ded cyclic duration factor percent	Starting class (c) Equivalent starts/hr
M1	Upto 5 cycles 25	25	90
M2	Upto 5 cycles 25	25	90
M3	10 to 15 cycles 40	40	150
M4	16 to 20 cycles 40	40	150
M5	21 to 30 cycles 60	60	300
M6	31 to 40 cycles 60	60	300
M7	41 to 50 cycles 100	100	600
M8	51 to 60 cycles 100	100	600

Table 9

Selection of motors for crane travel or trolley traverse :

It is assumed that the drive mechanism from the motor to the track wheels will use enclosed gearings mounted on anti-friction bearings. The actual efficiency of the drive will be adopted in making calculations. Where actual efficiency values are not available the efficiency of the drive shall be taken in the range of 0.85 to 0.9.

For the track wheel with anti-friction bearings the rolling friction at these bearing plus the Friction between the track wheels with an average drive efficiency of 0.875 will give an overall friction factor of 8.0 kgf per tonne of the mass moved for calculation of the motor horse power or torque. In the case of wheels with the plain bearings an overall friction factor of 13.0 kgf per tonne of the mass moved may be used.

Selection of motors for crane Travel or Trolley Traverse :

For bridge travel or trolley traverse the power of the motor required shall not be less than that computed from the following :

$$kW = \frac{MVSCdf}{6117T} \frac{(F+1100a)}{981N}$$

For indoor cranes

$$kW = \frac{MVSCdf}{6117T} \frac{(F+1100a)}{981N} + \frac{RwV}{6117T}$$

for outdoor cranes

Where

kW = one hour power rating for d.c motors and power rating at 40 percent cyclic duration factor for a.c motors.

M = mass of crane or trolley plus mass of max rated load in tonnes;

V = specified free running speed M/min;

N = mechanical efficiency of gearing. For spur and helical gears it can be taken as 0.95 per reduction.

T = Factor introduced by the permissible motor torque during acceleration exceeding the motor-rated torque. As a general guidance value of T may be taken as 1:7 for motors having pull out torque of 275 percent full load torque. Lower value of T should be taken for corresponding lower value of pull out torque.

= 1.3 of d.c motor pull out torque*100

= 1.6 for a.c motor 160*full load torque

F = overall friction factor

= 8kgf per tonne for wheel on anti friction bearing .

= 13 kgf per tonne for wheels on plane Bearings

Cdf = duty factor

Rwl = load due to service wind acting horizontally, which can be obtained by multiplying the horizontal exposed area by the service wind by taking drag co-efficient into consideration;

a = average linear acceleration of the crane or the trolley in cm/s² till the mechanism reaches 90 percent of free running speed.

For the value of average linear acceleration refer as given in table 10; and

S = service factor aimed at providing adequate motor heat dissipation capacity as given in table 10.

Acceleration Values

Speed to be Reached M/min	Acceleration in cm/s ² Low and Moderate speed with Long Travel	Acceleration in cm/s ² for Moderate and High Speed (Normal Application)	Acceleration in cm/s ² for High Speed with High Acceleration

Table 10**ENQUIRIES**

When making an enquiry or when ordering a crane duty motor, please furnish the following information. This will enable to supply you Prabal series motors most suitable for your cranes and hoists

1.0 DETAILS OF CRANE

- 1.1 Class of cranes
- 1.2 Type of crane
- 1.3 Tonnage of crane
- 1.4 Operating speed
- 1.5 Type of motion : Hoisting, or traveling or traversing.

2.0 ELECTRICAL FEATURES

- 2.1 Motor output (kW) and polarity
- 2.2 Supply voltage and frequency with variations.
- 2.3 Type of rotor: squirrel cage or slipring
- 2.4 Class of insulation and ambient temperature.
- 2.5 Method of starting
- 2.6 Requirement of starting torque, pull out torque, starting current.
- 2.7 Load torque of the driven equipment.
- 2.8 In case of slipring motors, requirements of rotor voltage and rotor current.
- 2.9 Type of power supply: Sinusoidal or through inverter drive.

3.0 DETAILS OF DUTY CYCLE

- 3.1 Duty type : S2, S3, S4, or S5.
- 3.2 Duty cycle details preferably with a sketch if different from S2, S3, S4, or S5.
- 3.3 No. of starts per hour.

- 3.4 Method of braking : plugging, dc injection /mechanical brake.
- 3.5 No. of reversals per hour.
- 3.6 Cyclic duration factor (CDF).
- 3.7 Load inertia referred to motor speed. (GD sq.)

4.0 MECHANICAL FEATURES

- 4.1 Enclosure.
- 4.2 Degree of protection.
- 4.3 Mounting.
- 4.4 Fixing dimensions: If Crompton Greaves standard motor fixing dimensions are not acceptable, please let us have your specific requirements, preferably with a drawing with a drawing.
- 4.5 Shaft extension : Please let us have your requirements of special shaft extension, if any, with a drawing.
- 4.6 Any other relevant data.

**CRANE DUTY INDUCTION MOTORS
TEFC SQUIRREL CAGE**

**PERFORMANCE DATA
INVERTER DRIVEN MOTORS - 8 POLE**

8 POLE : PERFORMANCE DATA FOR TEFC SQUIRREL CAGE CRANE DUTY INVERTER DRIVEN INDUCTION MOTORS

Standard operating conditions :

Voltage : 415 V ± 10%

Frequency : 50 Hz ± 5%

Ambient : 45°C

Altitude : upto 1000 m

Switching frequency : 3-6 khz

Voltage rise time : > 0.1 micro sec

THD : < 2.5%

S4 DUTY (8 POLE)

GENERAL PURPOSE CRANE DUTY MOTORS & CG PRABAL 'E' SERIES CRANE DUTY MOTORS OUTLINE DIMENSION DRAWING

CG PRABAL 'E' series motors are especially designed for cranes suiting special shaft dimensions and arduous electrical conditions having high number of starts. The motors are having compact designs giving high electrical outputs. The general arrangement drawings are as per page 36 & 37 and performance as per page 25 & 26.

3 PHASE SQUIRREL CAGE TEFC FOOT MOUNTED INDUCTION MOTORS

OUTLINE DIMENSION DRAWING (4 POLE & UP)

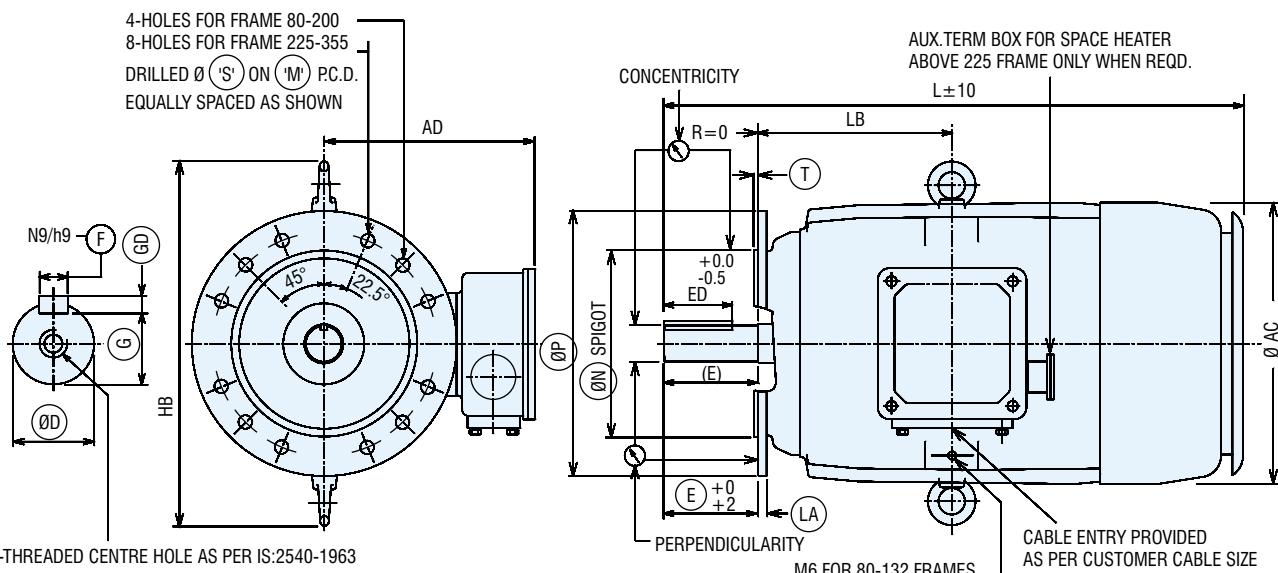

RINGED DIMENSIONS ARE AS PER IS:1231
ALL DIMENSIONS ARE IN mm

EARTHING TERMINALS OF M6 FOR 80-132 FRAMES.
M8 FOR 160-225 FRAMES.
M12 FOR 250-355 FRAMES
